

Northlace

Every cloud. One standard.

Every cloud. One standard.

Application modernization, cloud, DevOps, SRE, security, FinOps, Kubernetes, Terraform, and platform governance for AWS, Azure, GCP, IBM Cloud, and hybrid estates.

Run

Shield

Ledger

Shift

Modernization only creates value when ownership is clear

The source deck's pains all point to one root cause: no single operating standard across cost, release risk, security exposure, and fragile environments.

Cost has no owner

Cloud spend grows without accountable owners or week-one baselines.

Releases feel fragile

Manual release paths make delivery slow, risky, and hard to audit.

Exposure stays open

Cloud, application, and data controls are discovered late in the workflow.

Operations depend on heroics

Drift, weak observability, and unclear runbooks stretch incident response.

Northlace turns the scattered work into one governed motion: assess the baseline, prove value in one workload, and scale with KPI ownership.

The value case is already measurable

Use the source facts as a client conversation starter, then verify figures before client distribution.

84%

Kubernetes in production or evaluation among surveyed cloud consumers.

30%

Cloud resources commonly wasted, creating immediate FinOps opportunity.

\$4.88M

Global average cost of a data breach in 2024.

40%

Breaches involved public cloud, private cloud, and on-prem data.

57%

Top-performing firms broadly adopted application modernization.

What this means for clients

Modernization is a board-level value case across growth, resilience, security, compliance, and cost discipline. Start with a free assessment, quantify baseline pain, then fund the roadmap through quick wins.

Sources: CNCF Annual Survey 2023, IBM Cost of a Data Breach 2024, DORA 2024. Verify figures before client distribution.

Northlace is built for this 3S niche

A sharper niche keeps the offer focused enough to sell, pilot, and measure.

Specific Person

Growth-stage and mid-market companies on AWS, Azure, GCP, IBM Cloud, and hybrid estates. CTOs, VPs Engineering, platform leads, and cloud operations owners. TODO-COPY: tighten ICP (spend band, team size, sector).

Specific Problem

Cloud spend has no owner, releases are slow and risky, environments are fragile, and security exposure remains unresolved. The root cause is no single operating standard.

Specific Way

The Northlace Standard unifies Run, Shield, Ledger, and Shift through assess -> pilot -> scale KPI governance.

The Northlace Standard turns scattered work into governed progress

The unique mechanism is not another service menu. It is the operating path from baseline to scale.

- 01 Baseline the estate** Cost, risk, delivery, reliability, and modernization data are captured in week one.
- 02 Set the standard** Run, Shield, Ledger, and Shift define the rules every workload follows.
- 03 Prove one workload** A 90-day pilot validates the first economics, controls, and release improvements.
- 04 Govern the signals** KPI dashboards and executive reviews keep cost, risk, speed, and reliability visible.
- 05 Scale the cadence** Modernization waves expand only after the pilot proves the operating model.

In 90 days, prove the value before scaling the program

The promise is measured against the client's week-one baseline, not a generic benchmark.

Outcome

Lower cloud waste, faster and safer releases, hardened posture, and exec-grade visibility quantified against the week-one baseline.

Container

A 90-day pilot begins with a 2-3 week assessment, then proves one workload, quick-win FinOps action, or platform capability.

Illustrative guarantee: if the assessment does not find a fundable pilot path, Northlace turns the findings into an executive roadmap. TODO-OFFER: confirm guarantee terms. HUMAN_DECISION_GATE.

Four pillars keep modernization balanced

Each pillar owns a different failure mode, but the operating cadence is shared.

Northlace Run

Faster release paths with SLO-backed operations.

Northlace Shield

Controls embedded into delivery instead of bolted on late.

Northlace Ledger

Every cloud decision gets a cost signal people can act on.

Northlace Shift

Migration and modernization move in waves teams can absorb.

Northlace Run: DevOps, SRE, CI/CD, and observability. Northlace Shield: Security, compliance, and IaC governance. Northlace Ledger: FinOps and cloud cost optimization. Northlace Shift: Migrations, modernization, and AI-native adoption.

The service portfolio maps into one operating model

The source catalog stays intact, but buyers see where each service fits inside Northlace.

Run

CI/CD, IaC, SRE, observability, CloudOps, incident response, runbooks.

Shield

Cloud security, AppSec, penetration testing, encryption, policy, evidence.

Ledger

Cost assessment, rightsizing, commitment planning, budgets, forecasts.

Shift

Modernization, migration, container platforms, data, AI-native workflows.

Engagement models: free assessment, advisory roadmap, project delivery, modernization factory, platform squad, or managed operations.

Delivery moves from baseline to operating cadence

The source five-phase path is preserved with spacing that keeps step labels, timing, and artifacts readable.

Governance cadence: weekly delivery review, fortnightly architecture and risk review, monthly value realization, and executive steering.

The pilot has a clear 90-day onboarding path

A buyer can see exactly what happens before they commit to scale.

Day 0

Confirm sponsor, workload candidate, data access, meeting rhythm, and success definition.

Week 1

Capture cloud spend, delivery, reliability, security, and architecture baselines.

Weeks 2-3

Return scorecard, roadmap, pilot scope, KPI model, and fundable quick-win backlog.

Weeks 4-12

Execute one workload or capability with weekly delivery reviews and value tracking.

Day 90

Present results, lessons, scale options, and operate cadence for the next wave.

Every stage produces evidence leadership can use

The deliverables make the operating standard visible, auditable, and fundable.

Assessment pack

Readiness scorecard, technical debt map, dependency map, risk and cost baseline.

Architecture pack

Target-state blueprint, landing zone design, security model, governance model.

Execution pack

Migration playbooks, IaC modules, CI/CD templates, test and cutover plans.

Operations pack

Dashboards, runbooks, SLO/error budget model, FinOps reporting.

Security pack

Vulnerability report, remediation roadmap, retest evidence, compliance mapping.

Value pack

ROI model, KPI dashboard, quick wins backlog, executive roadmap.

Outcome KPIs: delivery, reliability, cost, security, modernization, and adoption.

Proof points stay anonymized until evidence is approved

Representative outcomes are useful in conversation, but external distribution needs client-approved evidence.

40% cloud cost reduction

Analytics platform optimization story: monitoring, waste reduction, and cost control.

72% faster deployments

Cloud engineering story: IaC and GitOps changed releases from days to minutes.

95% critical vulns remediated

Security testing story: phased testing and remediation validation.

1.2M+ users supported

Application modernization story for healthcare and wellness scale.

10,000+ systems tracked

Enterprise mobility story for IP litigation workflow.

30+ countries standardized

Global e-commerce platform standardization story.

TODO-METRIC: attach client-approved evidence before external distribution.

Replace assumptions with the client's week-one baseline

The ROI model is a conversation tool. It becomes credible only after assessment data replaces estimates.

Value lever	Annual value	Assumption
Baseline annual cloud spend	\$2,400,000	Monthly spend of \$200K
Cloud cost optimization	\$600,000	25% savings from rightsizing and waste cleanup
Release efficiency gain	\$360,000	10 engineers x 15% capacity unlocked
Incident reduction value	\$300,000	12 avoided hours x estimated business impact
Security risk reduction	\$250,000	Avoided remediation, audit, and exposure proxy
Total annual benefit	\$1,510,000	Illustrative benefit pool before investment
Sample program investment	(\$650,000)	Assessment, pilot, migration waves, automation
Illustrative net value	\$860,000	132% ROI and payback inside year one

How to use this slide

1. Replace assumptions with client baseline.
2. Validate savings with assessment data.
3. Separate hard savings from productivity and risk value.
4. Use a pilot to prove the first 90-day value case.

Illustrative only; final ROI depends on baseline spend, application criticality, delivery scope, and adoption.

Start free, prove value in a pilot, then scale what works

The offer ladder keeps the first yes small while making the scale path obvious.

Free assessment

No-cost discovery and baseline review across cloud readiness, cost, security, and modernization entry points.

90-day pilot

\$12K example entry price for one scoped workload or capability.
TODO-PRICE: confirm pricing and scope bands.

Scale and operate

Custom waves, platform squad, modernization factory, or managed operations based on pilot evidence.

quick wins found in the assessment routinely fund the pilot. Gated download decision: HUMAN_DECISION_GATE, default ungated for this publication.

Take the deck to leadership, then choose the first workload

Close with a free assessment, a 90-day pilot, baseline KPIs, and a funded modernization roadmap.

Cloud readiness assessment

Application inventory, dependency map, migration risk, downtime tolerance, and target cloud fit.

Cloud cost assessment

Spend baseline, idle waste, tagging gaps, commitment usage, quick wins, and FinOps roadmap.

Security assessment

Cloud posture, app/API testing scope, IAM risk, encryption gaps, and remediation priorities.

Modernization assessment

Technical debt map, UX friction, data/integration gaps, AI readiness, and modernization backlog.

Recommended close: book a 60-minute discovery session, share baseline artifacts, and receive a prioritized roadmap with quick wins and investment options.

NORTHLACE

Every cloud. One standard.

Northlace runs modernization as one standard

Run what changes. Shield what matters. Ledger what costs. Shift what must modernize.

Next step: choose one workload, confirm the assessment artifacts, and decide the 90-day pilot sponsor. Contact link: #TODO-LINK.
